Effective Blood Plasma Purification in Post-COVID

ALPSTEINCLINIC

GAIS / SWITZERLAND

INUSphere – more than a medical detoxification cure

Blood plasma purification to strengthen the immune defense and self-healing powers for chronic and acute diseases of the metabolism and the immune system

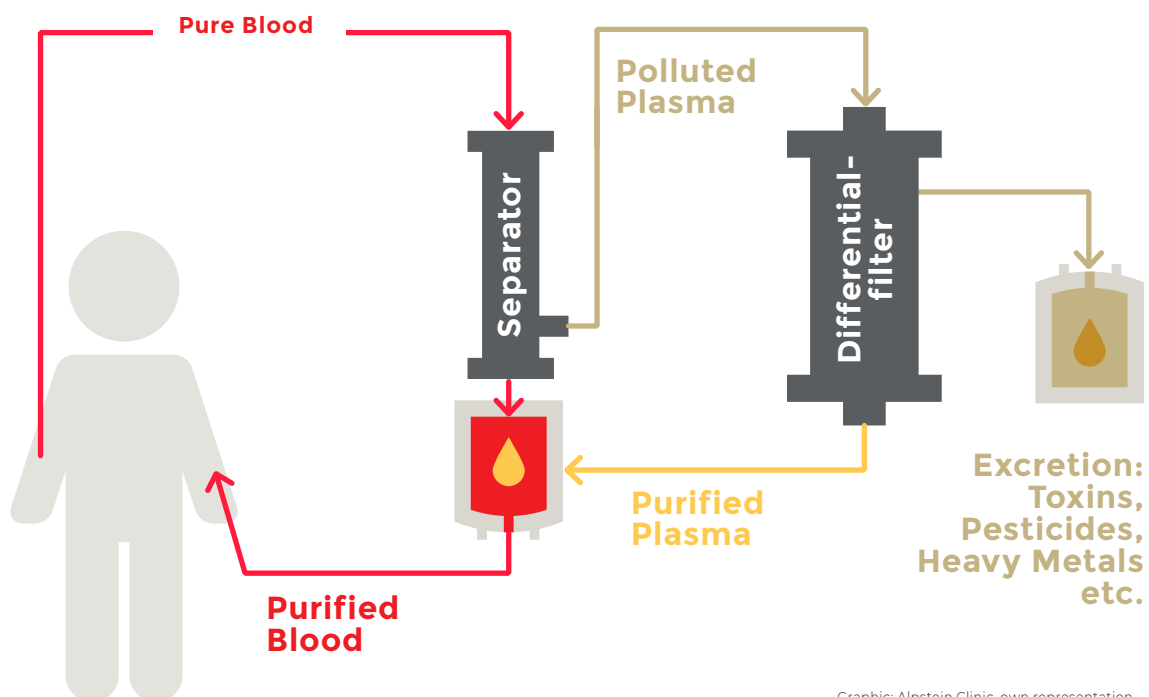

The removal of larger amounts of toxic hazardous substances from the body can be achieved very effectively by purification of the blood plasma and even more effectively by upstream treatment with toxin-binding substances known as chelates. For the rapid elimination of the hazardous substances in a significant order of magni-

- ✓ Removal of disease-promoting substances and environmental toxins from the blood
- ✓ Preservation of elemental proteins, electrolytes and immune system

tude developed a special “blood plasma filtration process”: INUSphere. The Alpstein Clinic offers this procedure as a certified INUSpartner in Switzerland and has close cooperation with the INUS centre in Cham (Germany); we have access to the worldwide experience in apheresis therapy - with advantages for INUSphere treatment:

- ✓ Gentle with few side effects
- ✓ Applicable on an outpatient basis, duration approximately 3 hours
- ✓ Holistic medical integration

How INUSphere® works at the Alpstein Clinic

Evidence-Based Indications

Post - COVID INUSphere

Chief physician Dr. Straube (day clinic in Cham) has presented data evaluation showing the connection of post and long covid and CFS (chronic fatigue syndrome) with an auto - antibody and conspicuous chronic inflammation.

In recent years, the formation of auto-antibodies to neurotransmitter receptors has been observed in over 471 CFS patients, often in combination with prominent chronic

inflammation and the presence of certain toxic substances were detected. The therapy of post and long COVID patients showed the same abnormalities with similar symptoms. It could be proven that INUSphere not only sustainably reduces this antibody, but also inflammation values and toxic loads. In 70% of the cases a significant improvement could be achieved. For post and long COVID a combination therapy is applied:

For this purpose, a 2-phase therapy with two different filters and a special membrane (TKM 58) is used:

- 1 INUSphere against micro thrombi and as an anti-inflammatory measure.
- 2 INUSphere filtering of immunological problem factors, pro-inflammatory cytokines, toxic loads and auto-antibodies using a special membrane.

Day 1
Filter 1 against micro thrombi in INUS therapy application

Day 2
Day supportive infusions (medically prescribed)

Day 3
Filter 2 is used by means of a special membrane in INUS therapy

Due to the extreme improvement of the microcirculation with simultaneous comprehensive relief of all other factors, the therapy result is optimized. A final medication ensures sustainability of the therapy. On average, the named two therapies have shown to be very beneficial in the initial treatment. After 3 to 6 months, further therapy may be necessary, depending on the findings, with a filter or the combination therapy is advisable.

In 14 years, a total of 1780 patients with over 528,000 different data relating to INUSphere in use for chronic time-related diseases were anonymously recorded and evaluated. Thus, the INUS Medical Center AG as a competence center is in possession of the largest existing data collection in relation to apheresis in use for chronic related diseases (cohort case study).
